Biofloc systems are also most suitable for species that can tolerate high solids concentration in water and are generally tolerant of poor water quality. Species such as shrimp and tilapia have physiological adaptations that allow them to consume biofloc and digest microbial protein, thereby taking advantage of biofloc as a food resource.

Development of biofloc system •It may take a few weeks, depends on the biomass. •First algae develop. Transition, foam formation then it get brown. •Transition is fast with tilapia, longer with shrimp •Add carbon if TAN is above ~2 mg/l •Adding clay, wheat bran etc. serves as seeding for biofloc formation.

Biofloc technology - University of Arizona

The major component of biofloc is heterotrophic bacteria. The function of the biofloc is to reduce the nitrogenous metabolic waste (ammonia, nitrite) produced by shrimp feeding and production. Ammonia consumed by heterotrophic bacteria becomes protein, which can then be consumed by shrimp and converted into growth.
